1 INTRODUCTION

The Wambo Coal Mine is an open cut and underground coal mining operation located approximately 15 kilometres (km) west of Singleton, near the village of Warkworth, New South Wales (NSW) (**Figure 1**). The Wambo Coal Mine is owned and operated by Wambo Coal Pty Limited (WCPL), a subsidiary of Peabody Energy Australia Pty Limited.

The South Bates Extension Underground Mine is a component of the approved Wambo Coal Mine. The South Bates Extension Underground Mine is scheduled to commence in Longwall 17 in September 2018 and involves extraction of coal by longwall mining methods from the Whybrow Seam within Coal Lease (CL) 397, Mining Lease (ML) 1594 and ML 1572 (**Figure 2**).

The potential environmental impacts of the existing Wambo Coal Mine were assessed in the *Wambo Development Project Environmental Impact Statement* (the Wambo Development Project EIS) (WCPL, 2003). Development Consent DA 305-7-2003 for the Wambo Coal Mine was granted on 4 February 2004 by the then NSW Minister for Urban Affairs and Planning under Part 4 of the NSW *Environmental Planning and Assessment Act, 1979* (EP&A Act).

An application to modify the Development Consent (DA 305-7-2003 MOD 17) to allow the development of the South Bates Extension Underground Mine (Longwalls 17 to 25) in the Whybrow Seam was approved in December 2017. The application was accompanied by the *South Bates Extension Modification Environmental Assessment* (WCPL, 2017).

1.1 PURPOSE AND SCOPE

Purpose: This Coal Resource Recovery Plan (CRRP) for Longwalls 17 to 20 has been prepared to demonstrate the effective recovery of the available resource at the South Bates Extension Underground Mine.

Scope: This CRRP includes Longwalls 17 to 20 of the South Bates Extension Underground Mine.

This CRRP has been prepared in accordance with Condition 22C(g) of Schedule 4 of the Development Consent (DA 305-7-2003) as a component of the South Bates Extension Underground Mine Longwalls 17 to 20 Extraction Plan. Condition 22C(g) of Schedule 4 of the Development Consent (DA 305-7-2003) requires:

> *22C. The Applicant must prepare and implement an Extraction Plan for the second workings within each seam to be mined to the satisfaction of the Secretary. Each Extraction Plan must:*
>
> *...*
>
> *(g) include the following to the satisfaction of the DRG:*
>
> - *a coal resource recovery plan that demonstrates effective recovery of the available resource;*

Plans 1 to 7 as described in the Draft *Guidelines for the Preparation of Extraction Plans Required under Conditions of Development Consents, Project Approvals and Mining Lease Conditions for Underground Coal Mining* (Version 5) (Department of Planning and Environment and NSW Trade & Investment – Division of Resources and Energy [DRE], 2015) are provided in **Attachment 1**. **Plan 1**, **Plan 2** and **Plan 7** (**Attachment 1**) present the approved mine plan, Longwalls 17 to 20 Application Area and surface features overlying Longwalls 17 to 20. **Plan 5** presents the current WCPL mining tenements and details land ownership.

This CRRP forms part of WCPL's Environmental Management System for the Wambo Coal Mine. The relationship of this CRRP to the Wambo Coal Mine Environmental Management System is described in Section 1.2 of the Extraction Plan.

2 RESOURCE DESCRIPTION

2.1 SITE GEOLOGY OVERVIEW

The Wambo Coal Mine is situated within the Hunter Coalfield subdivision of the Sydney Basin, which forms the southern part of the Sydney-Gunnedah-Bowen Basin (WCPL, 2003). The coal-bearing rocks of the Sydney Basin are Permian in age and are typically associated with low-lying gentle topography (WCPL, 2003). The overlying rocks of Triassic age cover large parts of the Sydney Basin and tend to form prominent escarpments where they outcrop (WCPL, 2003).

Mining activities at the Wambo Coal Mine include both open cut and underground mining of several coal seams from the Wittingham Coal Measures, which combine with the Newcastle Coal Measures to form the Singleton Supergroup (**Figure 3**). A summary of the coal measure stratigraphy underlying the Wambo Coal Mine area is provided in **Figure 3**.

Wittingham Coal Measures are divided into the Jerrys Plains Subgroup, Vane Subgroup, Denman Formation and Archerfield Sandstone (WCPL, 2003). The Jerrys Plains Subgroup contains eight formations with 15 named coal seams (WCPL, 2003). The Jerrys Plains Subgroup is up to 800 metres (m) thick and generally consists of relatively coarse clastic sediments (Department of Mineral Resources, 1993). The sedimentary rock layers above and between coal seams are typically lithic sandstone, siltstone and conglomerate, while minor carbonaceous claystone and tuff occurs throughout the sequence (WCPL, 2003).

Coal seams previously, currently and approved to be mined at the Wambo Coal Mine include (**Figure 3**):

- Whybrow Seam;
- Redbank Creek Seam;
- Wambo Seam;
- Whynot Seam;
- Arrowfield Seam; and
- Woodlands Hill Seam.

These seams dip gently to the south-west at approximately 2 to 3 degrees, with minor local variations due to varying thicknesses of inter-seam sediments and fault zones (WCPL, 2003). Faulting usually trends north or north-east to south-west with normal throws of up to 10 m, with some low angle thrusts (i.e. reverse faults) of variable throw (MineConsult, 2001).

The South Bates Extension Underground Mine mines the Whybrow Seam, which produces a low ash thermal coal. Run-of-mine (ROM) coal will be crushed and washed at the Wambo Coal Mine Coal Handling and Preparation Plant. Product coal from the South Bates Extension Underground Mine will be considered suitable for export and domestic markets.

WAMBO COAL MINE

Stratigraphy of the Wambo Coal Mine Area

Figure 3

2.2 OVERBURDEN LITHOLOGICAL AND GEOTECHNICAL CHARACTERISTICS

The overburden of the Longwalls 17 to 20 Application Area consists predominately of interbedded sandstone and siltstone layers, with minor claystone, mudstone, shale, tuffaceous and coal layers (Mine Subsidence Engineering Consultants [MSEC], 2018).

There are no massive sandstone or conglomerate units within the overburden. The largest is a 17 m thick sandstone layer located approximately 30 m above the Whybrow Seam. Otherwise, the thicknesses of the formations within the overburden are typically less than 10 m. Other boreholes in the vicinity of the mining area indicate the presence of other larger sandstone units with thicknesses up to 20 m in the lower part of the overburden (MSEC, 2018).

No adjustment factors have been applied in the subsidence prediction model for any massive strata units or for softer floor conditions, as the longwalls are supercritical in width and therefore are predicted to achieve the maximum subsidence for single-seam mining conditions (MSEC, 2018).

Estimates of the range of material strength and stiffness properties present in the overburden materials are summarised in **Table 1**.

Table 1
Strength Property Estimates for Lithology in the Vicinity of the South Bates Extension Underground Mine

Unit Lithology	Unit Thickness Range (m)	UCS Range (MPa)	Laboratory Elastic Modulus* Range (GPa)	Poisson's Ratio
Roof Material above Whybrow Seam	10 – 13	24 – 43 [36 mean]	11.5 – 12.2	0.155

* Young's Modulus (E) derived from laboratory and sonic UCS data, E = 300 x UCS (units are in GPa).

Note: UCS = unconfined compressive strength.
MPa = megapascal.
GPa = gigapascal.

2.3 LITHOLOGICAL AND GEOTECHNICAL CHARACTERISTICS (ROOF AND FLOOR STRATA)

The overburden of the Whybrow Seam predominately comprises of interbedded sandstone and siltstone layers, with minor claystone, mudstone, shale, tuffaceous and coal layers throughout the overburden (MSEC, 2018). Longwalls 17 to 20 will mine the Whybrow Seam.

Historical workings are discussed in **Section 2.6**.

Estimates of the range of material strength and stiffness properties present in the roof of the mine workings coal seams are summarised in **Table 1**.

2.4 EXISTENCE AND CHARACTERISTICS OF GEOLOGICAL STRUCTURE

Regional geological structure in the Longwalls 17 to 20 Application Area consists of several faults. The largest structure in the area is the Redmanvale Fault which has a throw greater than 20 m and is located to the south-west of the longwalls.

The first longwall in the series (i.e. Longwall 17) is located at a distance of 985 m from the interpreted location of the Redmanvale Fault at seam level. The successive longwalls in the series (i.e. Longwalls 18 to 20) progressively approach the fault, with Longwall 20 located closest to the fault at a distance of 590 m at seam level. The progressive mining towards the fault will allow the surface movements in the vicinity of the fault to be continually monitored and reviewed (MSEC, 2018).

There is a series of north to south trending faults through the north-eastern ends of Longwalls 17 to 20 and north-east to south-west trending faults through the south-western end of Longwall 17. These minor faults have throws up to approximately 5 m (MSEC, 2018).

2.5 STABILITY OF UNDERGROUND WORKINGS

The design intent of the workings and method of extraction is such that the first workings provide long-term stable access to the longwall blocks or pillar panels, and the second workings are mined such that the overburden collapses (i.e. "goafs") in a controlled manner as the coal is removed. All of the subsidence movements that occur at the surface are generally the result of a new equilibrium being achieved (i.e. chain pillars and overlying strata compress elastically and overburden caves and eventually ‘re-supports’ itself on bulked and broken ground).

DRG indicated it was satisfied that WCPL would achieve the required outcomes of the first workings condition of the Development Consent (DA 305-7-2003, Condition 22E of Schedule 4) for Longwalls 17 to 20 on 27 March 2018, subject to the following condition:

> *The Mine Manager must undertake adequate monitoring of the stability of first workings in the subject area and to implement appropriate ground support of the roadways in accordance with the results of the said monitoring, to ensure compliance with the outcome requirements of Schedule 4, Condition 22E of the Development Consent for DA 305-7-2003 (MOD12).*

The longwall blocks are also designed with barrier pillars at the ends of the blocks to protect the adjacent first workings pillars and remnant pillars left between the augered areas from any abutment loading. Adequate set-back from highwall crests is also provided.

The chain pillars are designed to provide serviceable gate roads for access and ventilation and may yield or crush out after mining is completed.

2.6 HISTORICAL MINING

There are no other currently existing longwalls immediately above or below Longwalls 17 to 20. The closest extracted longwalls are in the adjacent South Bates (Whybrow and Wambo Seam) Underground Mine, which is to the south-east of Longwall 17. Extraction in the Whybrow Seam (Longwalls 11 to 13) was completed in June 2017. Extraction of Longwall 14 in the Wambo Seam was completed in January 2018. Extraction of Longwall 15 is scheduled for completion in May 2018 and Longwall 16 is scheduled for completion in September 2018.

3 RESOURCE RECOVERY

3.1 MINING GEOMETRY

The currently approved orientation and footprint of the South Bates Extension Underground Mine was assessed as part of the *South Bates Extension Modification Environmental Assessment* (WCPL, 2017).

Longwalls 17 to 20 are the first four of nine longwalls at the South Bates Extension Underground Mine.

The layout of Longwalls 17 to 20 is presented in **Plan 1** (**Attachment 1**), and key panel dimensions for Longwalls 17 to 20 are presented in **Table 2**.

Table 2
Key Longwall Panel Dimensions

Dimension	Longwall 17	Longwall 18	Longwall 19	Longwall 20
Gate Road Width (m)	5.4			
Gate Road Height (m)	2.5 to 2.8			
Maingate Chain Pillar Width (m)	31	30	31	26
Tailgate Chain Pillar Width (m)	25	31	30	31
Longwall Void Width (m)[1]	261	261	261	261
Longwall Void Length (m)[2]	1,489	1,507	1,679	1,699
Extraction Height (m)	2.8 to 3.0	2.8 to 3.0	2.8	2.8

[1] Including gate roads.

[2] Including installation headings.

3.2 COVER DEPTH

The depth of cover above Longwalls 17 to 20 ranges from 50 m to 100 m above the finishing (north-eastern) ends of the longwalls, up to 200 m to 330 m above the commencing (south-western) ends of the longwalls.

The cover depth increases to the south-west, consistent with the seam dip and topography.

3.3 MINING METHOD

Longwalls 17 to 20 will be extracted using retreating longwall mining methods for secondary extraction of panels with approximately 261 m void width (extraction face of approximately 250 m). Construction of development main headings, maingates and tailgates will be undertaken using continuous miners.

3.4 MINING SCHEDULE

WCPL operates its mines seven days per week, 24 hours per day on a rotating shift basis. The proposed sequence of mining for Longwalls 17 to 20 at the South Bates Extension Underground Mine and anticipated/actual start and completion dates are summarised in **Table 3**.

Table 3
Proposed Mining Schedule (Secondary Extraction)

Longwall	Estimated Start Date	Estimated Duration	Estimated Completion Date
Longwall 17	September 2018	6 months	February 2019
Longwall 18	March 2019	6 months	July 2019
Longwall 19	August 2019	6 months	January 2020
Longwall 20	January 2020	6 months	June 2020

3.5 FUTURE MINING

Longwalls 21 to 25 at the approved South Bates Extension Underground Mine will be the subject of a future Extraction Plan.

In addition to the approved South Bates Extension Underground Mine, the Development Consent (DA 305-7-2003) provides consent for underground mining by longwall methods in the Arrowfield and Woodlands Hill Seams (**Figure 1**). The future workings in the Arrowfield and Woodlands Hill Seams are located to the south-east of Longwalls 17 to 20 (**Figures 1 and 2**). The approved future underground longwall workings are described in the Wambo Development Project EIS (WCPL, 2003) and *South Wambo Underground Mine Modification Environmental Assessment* (WCPL, 2016) and will be the subject of a future Extraction Plan.

Further to underground mining activities, the Development Consent (DA 305-7-2003) provides consent for open cut mining. The seams approved for open cut mining include the Whybrow, Redbank Creek, Wambo and Whynot Seams.

An application to modify the Development Consent (DA 305-7-2003 MOD 16) was lodged in November 2016 to support the proposed United Wambo Open Cut Coal Mine Project. The Modification would allow integrated open cut mining at the United Coal Mine and Wambo Coal Mine.

Mining of the Whybrow Seam by open cut mining methods in the South Bates Extension Underground Mine area is not viable due to increasing depth of cover and the presence of Remnant Woodland Enhancement Program (RWEP) areas.

3.6 RESOURCE RECOVERY

Resource estimates and proposed recovery for Longwalls 17 to 20 are summarised in **Table 4**. The mining layout for Longwalls 17 to 20 maximises resource recovery, which is estimated to be approximately 85%.

Table 4
Estimated Resource Recovery from Longwalls 17 to 20

Aspect	Million Tonnes
Available Resource	8.47
Development ROM Coal	0.64
Longwall ROM Coal	6.57
Total ROM Coal Recovered	**7.21**

The extent of Longwalls 17 to 20 is constrained by the extent of the approved South Bates (Whybrow Seam) Underground Mine to the south-east, faults to the north-west of the longwalls (Section 2.4), the extent of the approved Montrose West open cut pit to the north-east and the Wollemi National Park escarpment to the south-west.

3.7 MINE PLAN JUSTIFICATION

The sequence of underground mining at the Wambo Coal Mine has been adopted to minimise the potential for sterilisation of coal reserves. The **Approved Plan** (**Attachment 1**) presents the Longwalls 17 to 20 layout which has been developed in consideration of detailed exploration drilling and key environmental studies, as described in the *South Bates Extension Modification Environmental Assessment* (WCPL, 2017).

The monitoring of subsidence impacts associated with the extraction of Longwalls 17 to 20 is described in the Subsidence Monitoring Program for Longwalls 17 to 20 (Appendix H of the Extraction Plan) and the relevant management plans summarised in Section 3 of the Extraction Plan.
