

**North Goonyella Mine – Bulletin
November 7, 2018**

- Activities at the North Goonyella mine continue to move from containment phase to the assessment/planning stage.
- The site is still subject to strict exclusion zones with underground access prohibited and limited access to surface areas of the mine.
- The main activity on site - concrete sealing of the mined-out area of the 9 North longwall panel - is nearing completion.
- The mobile GAG unit remains deactivated and on stand-by mode.
- The North Goonyella team will continue to work safely from the surface to get the best understanding of underground conditions based on an expanded network of remote gas monitoring points – with a total of 35 remote monitors now in place throughout the mine.
- Underground camera images continue to be taken where possible, with signs of localised geologic and heating impacts in selected areas of the mine while other images show remaining areas of the mine unaffected.
- We continue to monitor temperatures, gas levels, seismic activity and surface air quality.
- This monitoring and assessment phase is necessary to allow advanced planning for re-ventilation, mine re-entry and potential restart of operations.
- All phases involve daily review and collaboration with the Queensland Mines Inspectorate.
